ABSTRACT

This project presents the development of a web-based Smart Campus Event Management System using Java and the Spring Boot framework . The main objective of the system is to simplify the process of creating, managing, and registering for campus events in an efficient and user-friendly manner. The application follows the Model-View-Controller (MVC) architecture , which ensures proper separation of concerns and improves maintainability. The system allows administrators to perform operations such as adding new events, viewing available events, updating event status, and deleting existing events. It also provides user registration and login functionality for secure access. Students can register for events through an OTP verification process, and email notifications are sent for successful account registration and event registration confirmation.

Spring Boot is used to handle backend processing and provide a robust environment for application development. Spring Data JPA is used for database interaction, while MySQL stores user details, event information, and registration records. An embedded Apache Tomcat server is used to run the application locally. The system can be accessed through a web browser and can also be tested on mobile devices within the same network. Overall, this project improves efficiency, reduces manual effort, and provides a secure and reliable solution for managing campus events.

Keywords: Event Management System, Spring Boot, Java, MVC Architecture, Web Application, Spring Data JPA, Thymeleaf, Database Management.

Chapter 1

INTRODUCTION

1.1 Introduction

In today's digital world, efficient event management is important for educational institutions and organizations. Traditional manual methods of managing events are time-consuming and prone to errors. To overcome these issues, the Smart Campus Event Management System provides a reliable web-based solution.

The system allows administrators to add, view, and delete events, while students can register for events through OTP verification. It also provides user registration, login, and email notification features for secure communication and better event handling. The application is developed using Java [12], Spring Boot [6], and MySQL [8] by following the Model-View-Controller (MVC) architecture [15].

1.2 Aim of the Project

The aim of this project is to develop a web-based system for managing campus events efficiently [6]. The system focuses on automating event creation, event registration, and user authentication to reduce manual effort and improve communication between administrators and students [8, 12].

1.3 Scope of the Project

The scope of this project includes developing a web-based Smart Campus Event Management System that allows users to create, manage, and view event details efficiently [6]. The system supports adding events, user registration and login, event registration through OTP verification, and sending email notifications [8]. It is designed for use in educational institutions such as colleges to manage campus events effectively [3]. The application can be accessed through a web browser on both desktop and mobile devices within the same network [14]. The project can be further extended by adding features such as payment integration, SMS notifications, and event analytics [5].

1.4 Framework

The system is developed using Spring Boot framework and follows the Model-View-Controller (MVC) architecture. Spring Data JPA is used for database operations, Thymeleaf for frontend development, and MySQL for data storage. The application runs on an embedded Apache Tomcat server.

Figure 1.1: Framework

Fig 1.1 shows the overall architecture of the Smart Campus Event Management System. It presents different layers such as user, presentation, application, and data layers. The system uses Spring Boot for processing, integrates email and OTP services, and stores data in a MySQL database.

Chapter 2

SURVEY OF SIMILAR APPLICATION IN MARKET

Several event management applications are widely used in the market, such as Eventbrite [1], BookMyShow, Townscript, and Meetup [2]. These platforms provide important features like event creation, ticket booking, participant registration, and notification services, which help organizers manage events efficiently and improve the overall user experience.

Applications like Eventbrite [1] and Townscript allow organizers to create and manage events, handle participant registrations, and communicate with attendees through notifications and updates. These platforms provide a structured system for event planning and participant management.

BookMyShow mainly focuses on ticket booking for entertainment events such as movies, concerts, and public shows. It provides users with easy ticket booking facilities and event discovery features. Meetup [2] is another platform that helps communities and groups organize events and connect with participants. Most existing applications are designed for large-scale public events and often include advanced features such as online payment integration, digital ticket generation, seat booking, and event analytics [5]. These features are useful for commercial and public event

management.

However, these platforms may not be suitable for internal campus event management, where simple registration, OTP verification, participant management, and direct communication are more important than commercial features. Many of these systems also include complex functionalities that may not be necessary for college-level event management [3, 4].

The Smart Campus Event Management System is designed specifically for educational institutions to manage campus events in a simple and efficient manner. It provides features such as user registration, login, event creation, event deletion, OTP-based event registration, email notifications, participant management, and mobile accessibility [6, 8].

Compared to existing market applications, the proposed system focuses on simplicity, secure authentication, and efficient management of internal campus events. The following table shows the comparative analysis of existing applications and the proposed system based on various features.

Table 2.1: Comparative Analysis of Market Applications

Feature	Eventbrite	BookMyShow	Townscript	Proposed System
Event Creation	Yes	No	Yes	Yes
User Registration/Login	Yes	Yes	Yes	Yes
Event Registration	Yes	Yes	Yes	Yes
OTP Verification	No	No	No	Yes
Email Notification	Yes	Yes	Yes	Yes
Participant Management	Yes	Limited	Yes	Yes
Event Deletion	Yes	No	Yes	Yes
Mobile Access	Yes	Yes	Yes	Yes
Campus Event Support	Limited	No	Limited	Yes
Admin Control	Yes	Limited	Yes	Yes
Event Status Tracking	No	No	Limited	Yes

Table 2.1 shows the comparison of existing event management applications with the proposed system. It highlights key features such as event creation, registration, OTP verification, and admin control, showing that the proposed system provides more complete functionality compared to other platforms.

Chapter 3

FRAMEWORK DESCRIPTION

3.1 Frontend Implementation

3.1.1 Environment Setup

The frontend of the application is developed using HTML, CSS, and basic JavaScript [13, 14]. The project is managed using the Spring Boot framework [6], where the frontend templates are placed in the `templates` folder. The development is done using Eclipse IDE, and the application is tested using a web browser.

3.1.2 Structure of the Project The project follows a structured organization to improve maintainability and proper separation of functionalities:

- **/src/main/java/com.example.event/controller:** Contains controller classes such as `EventController.java` to handle user requests, page navigation, event management, registration, login, and OTP verification [15].
- **/src/main/resources/templates:** Contains HTML files such as `login.html`, `signup.html`, `index.html`, `add.html`, `register.html`, `verifyOtp.html`, and `registrations.html` for user interface [11].
- **/src/main/resources/static:** Contains static resources such as CSS files and images used in the application.

3.1.3 Execution Procedure

The application is executed by running the main Spring Boot application file in Eclipse IDE. Once the server starts successfully, the application can be accessed through a web browser using:

```
http://localhost:9090
```

It can also be accessed on mobile devices connected to the same network using:

```
http://192.168.29.223:9090
```

After opening the application, users can perform operations such as signup, login, event creation, and event registration. OTP verification is used during event registration for security, and email notifications are sent after successful registration. The frontend interface provides easy navigation for users to perform operations such as viewing events, registering for events, and verifying registration through OTP.

3.2 Backend Implementation

3.2.1 Environment Setup

The backend of the Smart Campus Event Management System is developed using Java [12] and Spring Boot framework [6]. The development environment is set up using Eclipse IDE with Java Development Kit (JDK) and Maven for dependency management. Spring Boot dependencies are configured through the pom.xml file.

MySQL database [8] is configured for storing user details, event information, and registration records. The database connection, server configuration, and mail configuration are maintained in the application.properties file. The backend environment supports OTP verification, email notification, and event management operations efficiently. The system provides a simple interface for users and administrators to manage events efficiently.

3.2.2 Structure of the Project

The backend of the Smart Campus Event Management System follows a structured project organization for better code management and maintainability. The project is divided into different packages such as controller, service, repository, and model to handle various functionalities efficiently. The backend of the project is organized into different packages to maintain proper code structure and manage application functionalities efficiently.

- **/src/main/java/com.example.event/controller:** Contains controller classes such as `EventController.java` to handle user requests, page navigation, event management, registration, login, and OTP verification [15].
- **/src/main/java/com.example.event/service:** Contains service classes such as `EventService.java`, `RegistrationService.java`, `UserService.java`, and `EmailService.java` to handle business logic, OTP generation, email notifications, and event operations. This layer acts as a bridge between the controller and repository layers, ensuring proper execution of application functionalities.
- **/src/main/java/com.example.event/repository:** Contains repository interfaces such as `EventRepository.java`, `RegistrationRepository.java`, and `UserRepository.java` for database operations using Spring Data JPA [7].
- **/src/main/java/com.example.event/model:** Contains entity classes such as `Event.java`, `Registration.java`, and `User.java` to represent database tables via Hibernate [9].
- **application.properties:** Contains database configuration, server configuration, and mail configuration settings.
- **EventManagementApplication.java:** Main application file used to start and run the Spring Boot application.

3.2.3 Execution Procedure

The backend runs on an embedded Tomcat server [10] provided by Spring Boot. When the application starts, it listens on a specific port. Controllers handle incoming requests, process data through services, and return responses to the frontend.

Figure 3.1: Execution Procedure

Fig 3.1 shows the execution flow of the Smart Campus Event Management System. It illustrates how user requests pass through the web browser to the Spring Boot application, controller, service, and repository layers, interacting with the database and external email service to process and return responses.

3.3 Database Implementation

The application uses MySQL database [8] for storing user details, event information, and registration records. The database connection is configured in the `application.properties` file.

file by specifying the database URL, username, and password. Spring Data JPA [7] is used for database connectivity and operations such as insert, update, delete, and retrieval. Hibernate [9] is used for automatic table creation and updating. This ensures efficient data management in the application. The database configuration provides secure storage and easy retrieval of application data for efficient system performance.

3.1.2 Schema Structure

The database schema of the Smart Campus Event Management System is designed to store and manage application data in an organized manner. It consists of three main tables: Event, Registration, and User. Each table contains specific fields related to event details, participant registration, and user authentication. The schema structure helps in maintaining proper data organization and ensures easy retrieval and management of information.

3.1.3 Tables created

The database consists of three main tables used for storing and managing application data efficiently. Each table is designed to store specific information related to the system.

Event Table: Stores event details such as event name, date, location, and status. It helps in managing and displaying event information.

Registration Table: Stores participant registration details such as student name, event name, date, time, and email. It is used to maintain records of students registered for events.

User Table: Stores user account details such as username, email, and password for login and authentication. These tables are created automatically using Hibernate [9] through Spring Data JPA [7] configuration. The table structure supports easy insertion, deletion, updating, and retrieval of data. This improves the efficiency of data management and ensures proper functioning of the application.

Chapter 4

METHODOLOGIES

4.1 Project Architecture

The Smart Campus Event Management System follows the Model-View-Controller (MVC) architecture for better organization and maintainability [15]. The frontend layer handles user interaction through web pages, while the controller processes user requests and manages application flow. The service layer contains business logic, and the repository layer performs database operations using Spring Data JPA [7]. The MySQL database stores user, event, and registration details, ensuring efficient data management [8].

Figure 4.1: Project Architecture

Fig 4.1 shows the overall architecture of the Smart Campus Event Management System. It illustrates the interaction between client, backend (Spring Boot [6]), and data access layers, along with external services, where user requests are processed and stored in the MySQL database [8].

4.2 DataFlow Diagram

The Data Flow Diagram (DFD) represents how data moves within the system. It shows the interaction between the user, frontend, backend components, and the database. When a user performs an action, the request is sent through the web browser to the controller [15]. The controller forwards the request to the service layer, where the business logic is applied.

The processed data is then sent back through the same layers and displayed to the user. This flow ensures proper data handling and smooth communication between different components of the system [13, 14].

Figure 4.2: Data Flow Diagram

Fig 4.2 shows the data flow of the Smart Campus Event Management System. It illustrates how user inputs are processed through modules like authentication, event management, registration, and reporting, with data stored and retrieved from the database [7, 8].

4.3 Module 1:

User Management Module: This module manages user registration, login, and authentication using Java-based security logic [12]. It allows users to create accounts and securely access the system using their credentials. The module ensures that only authorized users can perform operations and helps maintain user information such as name and email.

4.4 Module 2:

Event Management Module: This module manages event creation, viewing, and deletion via the Spring Boot backend [6]. It allows administrators to add event details such as event name, date, location, and status. The module helps in organizing and maintaining event information efficiently.

4.5 Module 3:

Registration Module: This module manages participant registration for events. It verifies registration through OTP and stores participant details such as name, event, date, and email in the MySQL database [7]. The module also sends email notifications after successful registration.

Advantages of this Project

a) Easy to Use: The system provides a simple and interactive interface for users using Thymeleaf templates [11]. Even beginners can easily understand and use the application without difficulty.

b) Time Saving: Automation reduces the time required for managing events manually. Tasks such as adding, updating, and viewing events are completed quickly through efficient Spring Boot processing [6].

Disadvantages

a) Internet Dependency: The system requires an active internet connection to function properly for services like OTP and email notifications. Without connectivity, users cannot access the application.

b) Server Issues: If the server is down or running slowly, the performance of the application may be affected, causing delays in processing requests via the embedded Tomcat server [10].

Chapter 5

RESULTS AND DISCUSSIONS

The Smart Campus Event Management System was successfully designed and implemented using the Spring Boot framework [6]. The application provides a simple and efficient platform for managing campus events. The developed system supports user registration, login, event creation, event registration, OTP verification, and email notification functionalities.

5.1 System Modules and Features

The Smart Campus Event Management System is divided into different modules to perform various operations efficiently. The User Management Module handles user registration, login, and authentication for secure system access through Java-based logic [12]. The Event Management Module manages event creation, viewing, and deletion of event details, following the Model-View-Controller (MVC) architecture [15].

The Registration Management Module handles participant registration for events and stores registration details in the database using MySQL [8] and Spring Data JPA [7]. OTP verification is used to validate event registrations securely. The Email Notification feature sends OTP and confirmation messages to users after successful

registration.

These modules work together to provide efficient event management, secure access, and better communication between administrators and participants through a dynamic user interface developed with Thymeleaf [11].

5.2 System Testing and Validation

Table 5.1: Test Cases for Event Management System

Test Case ID	Test Case Description	Input	Expected Result
TC-01	Add New Event	Event Name: Birth-day Party, Date: 20-05-2026, Location: Chennai	Event is successfully added and displayed in the event list.
TC-02	Add Event with Empty Fields	Event Name: (empty), Date: (empty), Location: (empty)	System shows an error message asking to fill all required fields.
TC-03	Valid User Registration	Name: Sravanthi, Username: srav, Password: 1234	User is successfully registered and redirected to login page.
TC-04	Valid Login	Username: srav, Password: 1234	User is successfully logged in and redirected to home page.
TC-05	Invalid Login	Username: srav, Password: wrongpass	System displays “Invalid username or password” message.
TC-06	Register for Event	Student Name: Sravanthi, Event: Birthday Party	Registration is successfully saved and displayed in registrations list.
TC-07	View Registrations	Click on “View Registrations” page	All registered participants are displayed correctly.
TC-08	Delete Event	Click delete button for an event	Selected event is removed from the list successfully.

Table 5.1 shows the system testing and validation of the Event Management System. It includes various test cases such as event creation, user registration, login, and event operations, along with their inputs and expected results to verify system functionality.

5.3 System Interface Visualizations

5.3.1 User Registration Page

A user registration form titled "Create Student Account" in blue text. The form is set against a dark background. It contains several input fields: "Full Name" with a placeholder "Enter your full name", "Email" with a placeholder "Enter your college email", "Password" with a placeholder "Create a password", and "Phone Number" with a placeholder "Enter your phone number". Below these are two dropdown menus for "Department" and "Year of Study", both with "Select" as the initial choice. A prominent blue "Create Account" button is positioned below the dropdowns. At the bottom, a link reads "Already have an account? [Login here](#)".

Figure 5.1: Register

Fig 5.1 shows the User Registration page of the Smart Campus Event Management System. It allows users to create an account by entering their details. The information is stored in the database for login authentication.

5.3.2 User Login Page

From the below Fig 5.2, the Login page allows registered users to access the Smart Campus Event Management System by entering their username and password. The system verifies the credentials and provides secure access to the application.

The image shows a login interface for 'Campus Events'. It features a dark blue background with a central white rounded rectangle containing the login form. The form has a title 'Campus Events' in bold black text. Below the title are two input fields: 'Username' with the value 'vtu25847@veltech.edu.in' and 'Password' with masked characters '.....'. A red 'Login' button is positioned below the password field. At the bottom of the form, there is a line of text 'Admin: admin / admin123' and a link 'New student? Create account'.

Figure 5.2: Login

5.3.3 Email Notification Page

Figure 5.3: Email

From the Fig 5.3, the Email Notification page shows the confirmation message sent to the user after successful event registration. It confirms that the registration process is completed successfully and informs the user through email.

5.3.4 Home Page

Figure 5.4: Home

From the Fig 5.4, the Home page displays the list of upcoming events available in the Smart Campus Event Management System. It allows users to view event details such as event name, date, location, and status, and provides options to manage events.

5.3.5 Add Event Page

From the below Fig 5.5, the Add Event page allows admin to create and add new event details in the Smart Campus Event Management System. It collects information such as event name, date, location, and status, which are stored in the database for event management.

From the Fig 5.9, the Registered Students page displays the details of participants who have registered for events. It shows information such as student name, event name, date, and time, and allows management of registration records.

Chapter 6

CONCLUSION AND FUTURE ENHANCEMENTS

6.1 Conclusion

The Smart Campus Event Management System successfully simplifies the process of managing events in an efficient and organized manner [15]. The system provides features such as event creation, registration, and data management through a user-friendly interface [11]. By using modern technologies like Spring Boot [6] and MySQL [8], the application ensures reliable performance and easy data handling. It reduces manual effort, minimizes errors, and improves overall productivity.

6.2 Future Enhancements

The system can be further improved by adding advanced features such as email and SMS notifications for event updates [5]. User authentication can be enhanced using secure login methods and role-based access control [12]. The application can be extended to support online event registration with payment integration [1]. It can also be deployed on cloud platforms for wider accessibility [6]. Additionally, a mobile application version developed to improve user convenience and accessibility.

Chapter 7

ADDRESSING COMPLEX ENGINEERING PROBLEM AND SDG

7.1 Mapping of the Project to Complex Engineering Problem (CEP)

Table 7.1: Mapping of Project to Complex Engineering Problem (CEP)

Level	Attribute	Characteristics	Wks	Justification
WP1	Depth of Knowledge	Requires in-depth engineering knowledge	WK3–WK6	Knowledge of Spring Boot, MVC, database design, REST APIs, and frontend technologies.
WP2	Conflicting Requirements	Technical and non-technical conflicts	WK4–WK6	Balances usability with security and proper validation.
WP3	Depth of Analysis	Analytical and design thinking	WK3–WK5	Involves system design, database schema, and event handling logic.
WP4	Familiarity	Partially new problems	WK4, WK8	Includes real-time updates and user interaction features.
WP5	Applicable Codes	Limited standard solutions	WK6	Requires custom implementation for event management.
WP6	Stakeholder Needs	Multiple users	WK5–WK7	Supports students, organizers, and administrators.
WP7	Interdependence	System integration	WK3–WK6	Integrates frontend, backend, and database modules.

Table 7.1 represents the mapping of the project to Complex Engineering Problems (CEP). It highlights how the system involves various attributes such as depth of knowledge, analysis, conflicting requirements, and system integration. The table demonstrates the application of engineering concepts and technical skills required to design and develop a full-stack event management system.

7.2 Mapping of the Project to Complex Engineering Activities (CEA)

Table 7.2: Mapping of Project to Complex Engineering Activities (CEA)

EA No.	Attribute	Characteristics	Justification based on the Project
EA1	Range of Resources	Use of diverse technologies	Utilizes Spring Boot, Spring MVC, Spring Data JPA, Thymeleaf, HTML/CSS, and relational databases for full-stack development.
EA2	Level of Interactions	Complex interactions between modules	Manages interactions between event management, user registration, validation, authentication, and reporting modules.
EA3	Innovation	Application of modern technologies	Implements a web-based centralized platform with filtering, real-time updates, and secure admin operations.
EA4	Consequences to Society and Environment	Impact on users and society	Enhances student engagement and improves institutional efficiency while reducing manual errors and delays
EA5	Familiarity	Beyond standard practices	Combines web development, security, and data analytics into a unified system, extending beyond traditional event handling methods

Table 7.2 represents the mapping of the project to Complex Engineering Activities (CEA). It explains how the project utilizes diverse technologies, supports complex module interactions, and incorporates modern development practices. The table also emphasizes the impact of the system on users and its contribution toward improving efficiency and usability.

7.3 SDG Mapping

Table 7.3: SDG Mapping for the Project

SDG No.	SDG Title	Relevance to the Project
SDG 4	Quality Education	Facilitates student participation in academic events, workshops, and seminars, enhancing learning beyond the classroom.
SDG 9	Industry, Innovation and Infrastructure	Promotes digital transformation in educational institutions through a centralized event management system.
SDG 11	Sustainable Cities and Communities	Supports smart campus initiatives by digitizing event processes and improving resource management.
SDG 16	Peace, Justice and Strong Institutions	Ensures secure and transparent event handling through authentication and controlled access.
SDG 12	Responsible Consumption and Production	Reduces paper usage by enabling online event registration and management.

Table 7.3 represents the mapping of the project to Sustainable Development Goals (SDGs). It shows how the system contributes to quality education, digital transformation, sustainability, and secure management practices. The table highlights the social and environmental relevance of the event management system.
